The massive side panels are made of extruded aluminum and finished to a high level of precision. This material choice not only enhances the aesthetic appeal but also contributes to the overall durability and longevity of the product. The high efficiency of the power supply unit means that no high frequency noise is emitted for an internal oscillator. This also means that waveform compensation is not necessary, resulting in a cleaner output signal.

Loss consists only of the power required to carry over to the output. The introduced efficiency toroidal transformer and large electrolytic capacitors rated for 47,000 µF per section ensure that the energy conversion process is highly efficient. Rectification and smoothing is performed by two large aluminum electrolytic capacitors, which provide the necessary filtering and smoothing properties to the AC energy from the input. Since the PS-1230 operates with alternating current, most of the energy is indirectly converted to direct current, which is then used to power the audio or video components.

The specifications and appearance of this product are subject to change without notice. The 230 V AC and 120 V AC versions of the PS-1230 differ regarding meter voltage indication, AC output connector shape, supplied power cord, etc. Make sure that you have the correct version. This product is designed to improve the quality of AC power supplied to audio or video components. Do not use it to power industrial type equipment or common household electrical generators or other types of power sources. This product can be used only on a regular household AC circuit rated for 230 V or 120 V AC, 50/60 Hz. Using the product with portable AC generators, airplane or ship power will void the warranty. Be sure to check actual applied voltage (230 V or 120 V) with the meter when connection is made. The rated power limit of the PS-1230 is 1200 VA. This figure represents the so-called usable power supply. The maximum continuous power is 1000 VA for the 120 V version and 1000 VA for the 230 V version. When deciding on equipment to be used with the PS-1230, the instant peak current capacity is important to consider. The PS-1230 has an instant peak current capacity of 160 A for the 120 V version and 80 A for the 230 V version.
Amazingly pure energy with momentary 80 A (160 A) current capability ——
Clean AC source with revolutionary waveform shaping technology delivers up
to 1200 VA (1000 VA)

Every audio component draws all of its energy from the power supply which in turn is connected to the AC power grid. The Clean Power Supply components from Accuphase are products that remove noise and impurities from the AC power line through a groundbreaking new approach, resulting in a drastic improvement of the sound and picture quality of connected audio and video equipment. Without relying on an oscillator, the reference waveform is created with further improved accuracy and is linked to the power section by a balanced connection to ensure incredibly low distortion in the output waveform. Because the PS-1230 can deliver as much as 1200 VA (1000 VA), it covers the requirements of almost any high-quality A/V system currently on the market.

Innovative Technology

**Low-distortion reference waveform generator**

To generate the 230 V (120 V) sine wave reference signal, the zero-cross point at the secondary winding of a measurement circuit transformer is detected by a comparator and used by the high-precision power supply to generate a square waveform. The square wave is then routed through a newly developed 50/60 Hz band pass filter and a six-stage band elimination filter (BEF). The filter frequency is switched in sync with the input frequency, for automatic 50 Hz and 60 Hz support. By routing the signal through another band pass filter, a low-distortion sine wave (reference signal) is created that is not dependent on the input voltage.

**Outstanding waveform compensation power**

Figure (a) shows a severely distorted waveform such as commonly encountered in ordinary AC outlets at home. Simple filtering will never be able to bring this waveform back to the intended shape. Figure (b) shows the condition where noise is affecting the AC power. Filtering will be able to remove some of the higher frequency noise components but low frequency components are very difficult to remove. The PS-1230 incorporates power waveform shaping technology that uses a clean reference waveform and works in real time to provide exactly the required compensation and remove any unwanted components. Distortion is reliably eliminated and the result is a perfectly clean source of energy.

Clean and Powerful Energy Supply

Power supply waveform and clean PS-1230 output waveform
Almost all electrical devices used in a household convert the AC supplied by the outlet into a DC current for powering internal circuits. This task is performed by a rectifier. As shown in photograph ₃, the rectifier load current has a pulse waveform with a large current flowing momentarily in the vicinity of the voltage peak. This causes a voltage drop, resulting in clipping of the voltage waveform, as shown in photograph ₄. A clipped waveform with a high amount of distortion contains many unwanted frequency components, or harmonics, as shown in the left-side graph below. When entering the audio circuitry of an amplifier through the power supply, such harmonic components can interfere with the audio signal and cause intermodulation distortion which greatly affects sound quality.

When passing through the PS-1230, harmonics within the audible range are largely removed (frequency spectrum in the right-side graph below), and the result is a clean sine waveform as shown in photograph ₅.

Dedicated left and right heat sinks ensure ideal thermal dissipation
The power amplifier section (with heat sinks) is separated into two parts positioned on the left and right side of the chassis, for maximum thermal dissipation efficiency.

Advanced Features

Three-step interference rejection
The input side of the PS-1230 is equipped with a line filter for removing any high-frequency noise components present in the power line, such as generated for example by digital equipment. The primary and secondary windings of the power transformer are kept totally separate, and the fully shielded design shuts out any externally induced noise. Since the amplifier uses the feedback principle, output impedance is extremely low. This prevents any possibility of mutual interference between components connected to the outputs of the PS-1230. The graph above shows the frequency spectrum of the power line and of the PS-1230 output. It can be clearly seen that harmonic components in the audible frequency range are almost completely removed when power passes through the PS-1230.

Built-in meter allows easy monitoring of output power (VA), input/output voltage (V), and output/input distortion (%)
Overload indicated by flashing LEDs
The power consumption of audio components such as integrated amplifiers or power amplifiers differs considerably depending on the volume. Being able to check while actually playing music is therefore highly useful. The meter of the PS-1230 lets the user see at a glance how much power the connected equipment is consuming at any given time. If the maximum rated output power of 1200 VA (1000 VA) is exceeded, the meter function selector LEDs flash as a warning indication.

Reliable protection functions
If any kind of problem should occur during operation, the circuit protector immediately is triggered to protect the unit and any connected components from possible damage.

Exceptional current capability
The power amplifier which performs the waveform adding/subtraction action is designed for ample waveform compensation performance and complete operation stability. The final stage employs bipolar power transistors rated for a maximum current of 15 amperes. These devices are connected in a 20-parallel complementary push-pull arrangement which boasts a rated output current of 5.2 A (8.3 A) and an instantaneous peak current (inrush current) rating of 80 A (160 A). This demonstrates the excellent current capability of the PS-1230.

Metro
Depending on the setting selected with the function buttons, the following information is shown.

- DISTORTION scale (%)
- VOLT-AMPERE scale (VA)
- VOLTAGE scale (V)

Assembly with input voltage/distortion monitoring circuitry
Meter of 230 V AC version

Meter operation OFF button
Turns meter operation and meter illumination on or off.

Meter function selection pushbuttons
- Combined power consumption (VA)
- AC input voltage (V)
- AC output voltage (V)
- AC input distortion (%)
- AC output distortion (%)

Assembly with protection circuitry
The PS-1230 uses a massive toroidal type power transformer with high output capability. Rectification and smoothing is performed by two large aluminum electrolytic capacitors rated for 47,000 µF and built for high sound quality applications. This provides more than ample leeway.

AC voltage stabilizer based on waveform shaping technology

The control circuitry of the PS-1230 is operating with alternating current. Most of the AC energy from the input is therefore carried over to the output. The introduced loss consists only of the power required for waveform compensation, resulting in high efficiency and eliminating the need for an internal oscillator. This also means that no high frequency noise is emitted for an internal oscillator. This also means that the total remains within these limits, and check actual power consumption using the meter.

Elegant side panels made of extruded aluminum

The massive side panels are made of extruded aluminum and finished to a high gloss, perfectly complementing the champagne-colored front panel and creating an exquisite look.

**Advanced Features**

- Strong power supply with high-efficiency toroidal transformer and large filtering capacitors (47,000 µF x 2)
- Built-in meter for monitoring vital parameters
- Low-distortion reference waveform generator
- Strong power supply with high-efficiency toroidal transformer and large filtering capacitors (47,000 µF x 2)
- Elegant side panels made of extruded aluminum
- Outstanding current capability

**Caution**

- The specifications and appearance of this product are subject to change without notice.
- Do not use this unit for powering equipment where failure incurs a risk of injury or fatal accidents (medical equipment, aviation equipment, traffic control equipment, furnace and heating control equipment, safety devices, etc.). Accuphase will not be liable for any problem occurring due to use of the PS-1230 with the above type of equipment.
- The power consumption of electrical equipment, as indicated on the equipment itself and in catalogs and other documentation according to legal requirements, is usually given in watts (W). This figure represents the so-called apparent power. However, the actual power drawn by the equipment is larger than the effective power. This is called the apparent power which is calculated by multiplying the applied voltage (230 V or 120 V) with the actual current. The unit for apparent power is VA (Volt-Ampere).

**Front Panel (The photograph shows the 230 V version.)**

- Power switch/circuit protector
- Meter operation OFF button
- Meter function selector buttons
  - VOLT-AMPERE (VA)

**Rear Panel (The photograph shows the 230 V version.)**

- AC outlets 8 outlets on rear panel
- AC power connector

**PS-1230 Meter (Power) Indication and Load**

The power consumption of electrical equipment, as indicated on the equipment itself and in catalogs and other documentation according to legal requirements, is usually given in watts (W). This figure represents the so-called effective power. However, the actual power drawn by the equipment is larger than the effective power. This is called the apparent power which is calculated by multiplying the applied voltage (230 V or 120 V) with the actual current. The unit for apparent power is VA (Volt-Ampere).

- The rated power limit of the PS-1230 is 1200 VA for the 230 V AC version and 1000 VA for the 120 V AC version. When deciding on equipment to be connected, select components so that the total remains within these limits, and check actual power consumption using the meter.
- In case of overload, the meter function selector LEDs flash. Reduce the load by reducing the number of connected components until the LEDs stop flashing and stay constantly lit.
- The power consumption of integrated amplifiers and power amplifiers varies considerably depending on the actual audio output. After connecting such equipment, perform playback and verify that power consumption does not exceed the maximum rating when peaks in the music are reproduced at high volume levels.
